Received 12 January 2009; accepted 14 January 2009

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\cdot)$ = 0.000 Å; disorder in main residue; R factor = 0.043; wR factor = 0.117; data-to-parameter ratio = 11.5.

The title compound, $C_{18}H_{21}N_3O_3$, is a potential bidentate Schiff base ligand. The whole molecule is disordered with a refined site-occupancy ratio of 0.567 (4):0.433 (4) and not just one ethyl group as reported previously [Sarojini *et al.* (2007). *Acta Cryst. E63*, o4782–o4782]. Using the whole molecule disorder, R values are much smaller than those published. An intramolecular O—H···N hydrogen bond generates a six-membered ring, producing an *S*(6) ring motif. The dihedral angle between the mean plane of the two benzene rings (major component) is 9.0 (5)°. The crystal structure shows short C···C [3.189 (15)–3.298 (12) Å] and C···O [2.983 (5)–3.149 (13) Å] contacts. Intermolecular C—H···O interactions link neighbouring molecules into dimers with $R_2^2(18)$ motifs. In the crystal structure, these dimers are linked together by intermolecular C—H···O interactions into one-dimensional extended chains along the *b* axis. The crystal structure is further stabilized by intermolecular π – π stacking interactions [centroid–centroid distances = 3.458 (8)–3.691 (6) Å].

5-Diethylamino-2-[(E)-(4-methyl-3-nitrophenyl)iminomethyl]phenol: a redetermination

H.-K. Fun, R. Kia, A. M. Vijesh and A. M. Isloor

Comment

Compounds with the structure of $-C\equiv N-$ (azomethine group) are known as Schiff bases, which are usually synthesized by the condensation of primary amines and active carbonyl groups. The chemistry of the carbon-nitrogen double bond plays a vital role in the progresses of chemistry (Patai 1970). They have been used as intermediates in medical substrates and as ligands in complex formation with some metal ions (Tai *et al.*, 2003). Recently multi-dentate complexes of iron and nickel showed high activities of ethylene oligomerization and polymerization (Ittel *et al.*, 2000). They have shown biological activities including antibacterial (Kabeer *et al.*, 2001; Pandeya *et al.*, 1999), antifungal (More *et al.*, 2001; Singh & Dash 1988), anticancer (Isloor *et al.*, 2009; Pathak *et al.*, 2000), anti-inflammatory (Vazzanaa *et al.*, 2004) and herbicidal (Samadhiya & Halve 2001) activities. In addition, Schiff bases have also been used as starting materials in the synthesis of large bioactive and industrial compounds via ring closure, cycloaddition and replacement reactions (Aydoğan *et al.*, 2001).

In the title compound, (I), (Fig. 1), an intramolecular O—H···N hydrogen bond generate a six-membered ring, producing S(6) ring motif (Table 1). Intermolecular C—H···O interactions link neighbouring molecules into dimers with $R_2^2(18)$ motifs (Table 1, Fig. 2). The whole molecule is disordered with a site occupancy ratio of 0.567 (4)/0.433 (4) and not just the ethyl group as mentioned in the previously reported article (Sarjini *et al.*, 2007). Using the whole molecule disorder, R-values are much smaller than those published.

The two substituted benzene rings are not coplanar and make a dihedral angle of 9.0 (5) $^\circ$ (for major component A). The interesting features of the crystal structure is short C1A···C8Aⁱ [3.298 (12) Å; (i) 1-x,-y,2-z], C1B···C8Bⁱ [3.329 (16) Å], C3B···C12Bⁱ [3.189 (15) Å], C15A···O3Aⁱⁱ [2.983 (5) Å; (ii) 3/2-x,-1/2+y,3/2-z], C8B···O3Bⁱⁱⁱ [3.149 Å; (iii) -x,-y,1-z], and C13B···O3Bⁱⁱⁱ [3.116 (15) Å] contacts which are shorter than the sum of the van der Waals radii of these atoms. In the crystal structure, these dimers are linked together by intermolecular C—H···O interaction into 1-D extended chains along the *b*-axis (Fig. 3). The crystal structure is further stabilized by weak intermolecular π – π interactions [$Cg1 \cdots Cg2^i = 3.7744$ (6) Å; $Cg2 \cdots Cg3^i = 3.473$ (7) Å; $Cg3 \cdots Cg4^i = 3.458$ (8) Å and $Cg1 \cdots Cg4 = 3.670$ (7) Å; $Cg1$, $Cg2$, $Cg3$, and $Cg4$ are the centroids of the C1A–C6A, C8A–C13A, C1B–C6B, and C8B–C13B benzene rings].

Experimental

An equimolar mixture of 4-(diethylamino)-2-hydroxybenzaldehyde (0.5 g, 2.59 mmol) and 4-methyl-3-nitro aniline (0.393 g, 2.59 mmol) in ethanol (10 mL) were refluxed for 4 h. Catalytic amount of sulfuric acid was also added. The precipitated solid was filtered and recrystallised from acetone to yield orange coloured crystalline solid [0.41 g, 82 %, m.p 405 K].

Refinement

H atoms of the hydroxy groups were positioned by a freely rotating O—H bond and constrained with a fixed distance of 0.84 Å. The rest of the hydrogen atoms were positioned geometrically and refined using a riding model with C—H = 0.95–0.99

supplementary materials

\AA and $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5 U_{\text{eq}}(\text{C})$. A rotating-group model was applied for the methyl hydrogen atoms of the methoxy groups. Rigid bond, similarity and simulation restraints were applied.

Figures

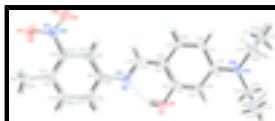

Fig. 1. The molecular structure of (I), showing 50% probability displacement ellipsoids and the atomic numbering. Intramolecular hydrogen bond is shown as a dashed line. Open bonds show the minor component.

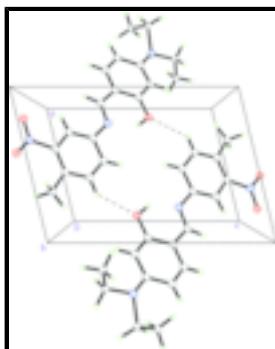

Fig. 2. The crystal packing of the major component of (I), viewed down the b -axis, showing dimer formation by a $R_2^2(18)$ motif.

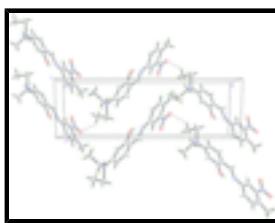

Fig. 3. The crystal packing of the major component of (I), viewed down the c -axis, showing 1-D extended chain along the b -axis.

Data collection

Bruker SMART APEXII CCD area-detector diffractometer	4744 independent reflections
Radiation source: fine-focus sealed tube	3239 reflections with $I > 2\sigma(I)$

Monochromator: graphite	$R_{\text{int}} = 0.037$
$T = 100(1)$ K	$\theta_{\text{max}} = 30.1^\circ$
φ and ω scans	$\theta_{\text{min}} = 2.2^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2005)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.956$, $T_{\text{max}} = 0.997$	$k = -31 \rightarrow 31$
21678 measured reflections	$l = -14 \rightarrow 14$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.043$	H-atom parameters constrained
$wR(F^2) = 0.117$	$w = 1/[\sigma^2(F_o^2) + (0.0561P)^2 + 0.1724P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\text{max}} < 0.001$
4744 reflections	$\Delta\rho_{\text{max}} = 0.21 \text{ e \AA}^{-3}$
412 parameters	$\Delta\rho_{\text{min}} = -0.22 \text{ e \AA}^{-3}$
1197 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Experimental. The low-temperature data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
